

CARPAL

POLES FOR STREET LIGHTING

**CATALOG
LIST
2018-2019**

It is the spring of 1994 when Alberto Cardone and Bruno Palumbo planted the seed of what would become a leading company in the lighting industry.

Carpal srl is born.

Located first in Pomigliano D'arco, in the province of Naples, the small company begins to take the first steps characterizing itself for its handicraft connotation.

Since then the growth is incessant.

Several and numerous achievements: moving the company headquarters to a new site located in the industrial area of San Marco Evangelista, in the province of Caserta, point strategic as it is close to the main road communication arteries, certification ISO 9001: 2008, CE marking of lighting poles according to EN40 standard.

The range of products offered extends to include elements of equipment such as lighting bodies and decorative accessories.

Over the years, the sons of the members also join the company (Fortunato and Lucia Cardone, emanuele, Marco and Luca Palumbo) that provide new stimuli for new challenges.

A nationwide commercial network is beginning to emerge which guarantees and consolidates the position on the market and reinforces the recognition of products.

The result of the experience gained is also the placing on the market of a new line of poles designed for urban furniture, innovative solutions that open the doors to new markets and provide new business prospects.

Thanks to a constant search for the quality, we have reached two important goals.

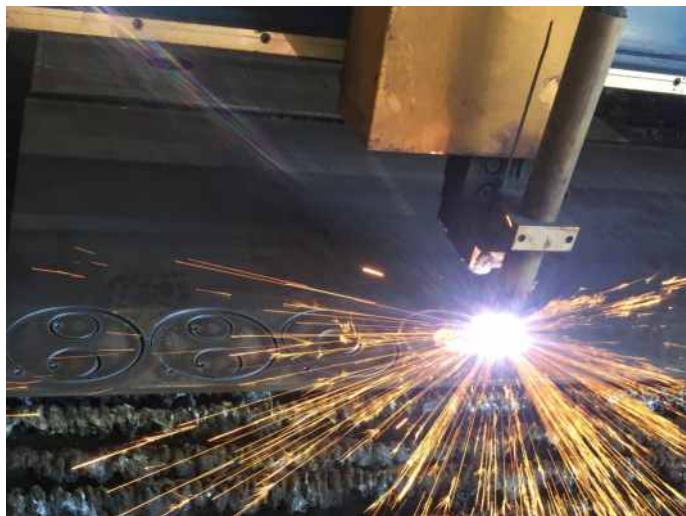

The first is management, with the achievement of ISO 9001 certification.

This achievement has allowed us to set up an efficient strategic planning aimed at the creation of management models for the improvement of the business processes.

The second goal is of a technical nature, thanks to the achievement of the CE marking of the product in compliance with the European standard EN 40 "Poles for public lighting".

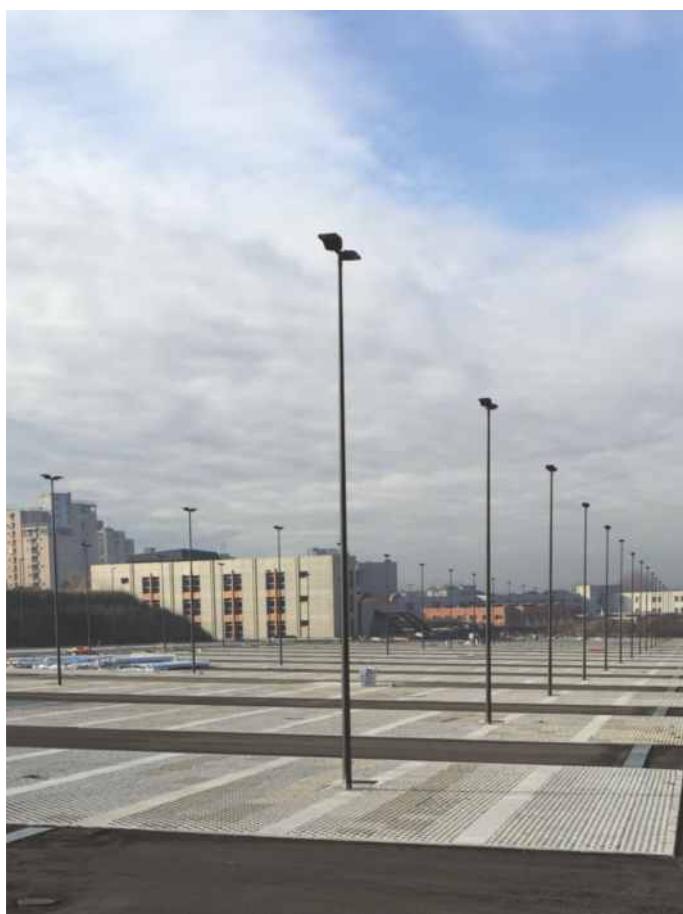

Entry into force in 2005 in all EU countries also in Italy the standard introduces specific rules for the design and construction of supports.

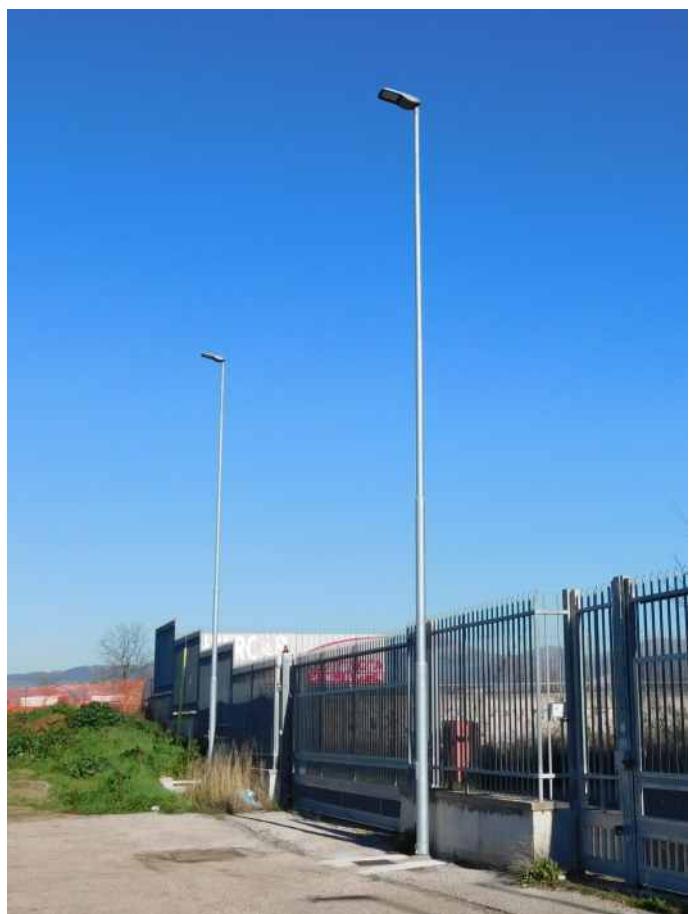

The CE marking offers the customer high guarantees both in terms of duration and safety.

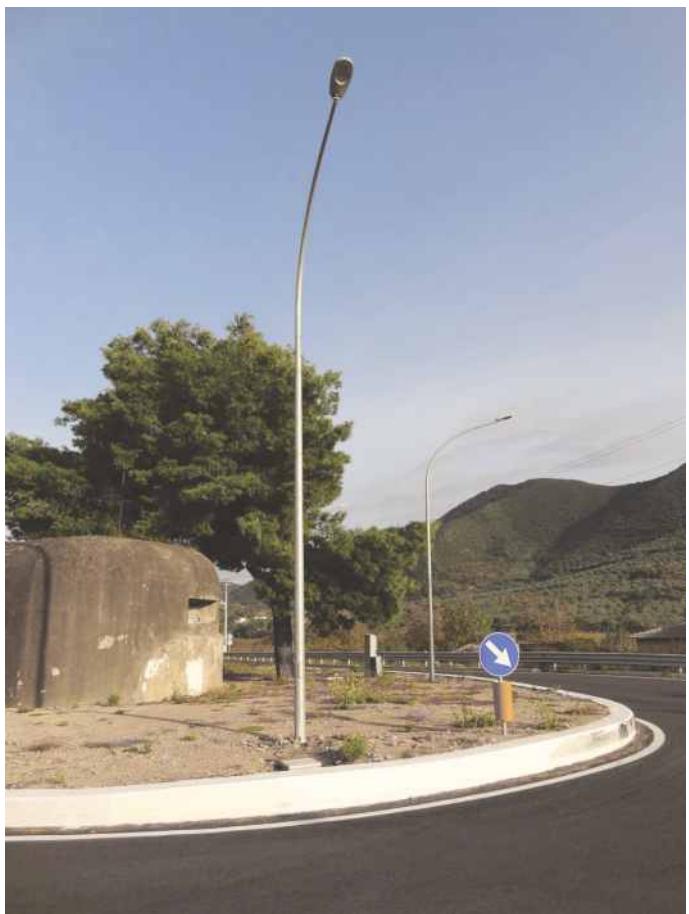

CHOICE OF POLE BY WIND CONDITIONS AND GROUND CATEGORIES

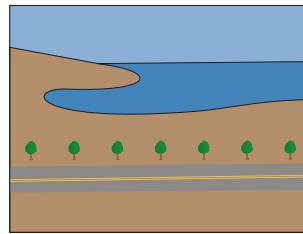

Choice of pole by wind conditions and ground categories According to the Ministerial Decree of January 14, 2008 "NEW TECHNICAL STANDARDS FOR CONSTRUCTIONS "the choice of the pole according to the height above ground and the load on top (PERFORMANCE NET) must be made in consideration of the wind conditions in the area installation and categories of land.

TABLE OF VENTOSITY

CATEGORY OF LANDS

Category of land "I"

Sea coast. Coast of lake with at least 5 Km. Windward length. Plane land, without obstacles.

Category of land "II"

Cultivated land fenced by hedges, some small agricultural buildings, houses or trees.

Category of land "III"

Suburban or industrial areas and permanent forests.

Category of land "IV"

Urban areas where at least 15% of the surface is covered by buildings with an average height of more than 15 m.

GALVANIZING PROCESS

This treatment ensures double protection to steel metallurgy and electrochemistry, preventing the formation of rust.

By immersion of the steel poles in a bath of molten zinc at about 450° during which determines a reaction steel/zinc which leads to a diffusion of zinc in iron with formation of Fe-Zn alloy, giving predominance of pure Zn on the surface.

The Fe-Zn alloy gives the hot dip galvanizing of particular qualities as, increased abrasion resistance and excellent corrosion resistance.

The galvanizing process ensures a protective barrier between the internal and external atmosphere and the steel along the surface of our products.

GALVANIZING PROCESS

The phases of the galvanizing process are:

- 1. Preparation:** the materials are hung by wire and / or chains / equipment to <> frames <> to allow the movement along the entire production process.
- 2. Degreasing:** elimination of oil and fat from the surface of products by dipping in acidic degreasing solution, with added surfactants.
- 3. Pickling:** removal of iron oxides and iron residuals of rolling, using immersion in solutions composed of hydrochloric acid (HC1) and water (H2O).
- 4. Washing:** elimination of waste acids, the previous processes, and through immersion rinsing in water.
- 5. Flushing:** immersion of the articles in an aqueous solution of «double salt» composed of zinc chloride and ammonium chloride ($ZnC12-2NH4C1$).
- 6. Pre-heating:** the articles are heated in the oven dryer at about 100-120° C so that dried the flushing salts and reduce the thermal shock at the time of immersion in hot dip galvanizing.
- 7. Galvanizing:** immersion in a bath of molten zinc (Zn 98.5% min.) at a controlled temperature of 440-450 ° C.
- 8. Cooling:** natural cooling in the air at room temperature.
- 9. Detachment and control:** posting materials from the frames, quality control and finally packaging and finishing.

PROCESS OF PAINTING (EPOXY POWDER COATING PROCESS)

On request, the appearance of the products Carpal can be improved through a drawn painting operation performed polyester powder.

The process of polyester powder painting develops in the following phases:

1. Pretreatment

Process Engineering: shot blasting machine is via automatic modular jet with spherical metallic grit for the removal of surface impurities allowing the elimination of oxides, welding slag, ash and lumps.

Chemical Process of Phosphodegreasing: by degreasing the material is cleaned by waste machining oils and after with the use of phosphates is allows the powder paint to have a good seal adhesion.

2. Painting

Thermodrying: a process that occurs in a tunnel of controlled ventilation to ensure that the poles and accessories come in spray booth perfectly dry.

Thermosetting powder coating: A process that takes place in the cabin of the latest WAGNER generation fully automatic self-cleaning and allowing a perfect powder distribution up to 70/80 microns thick.

3. Polymerization

Cooking: at this stage polymerization takes place in the oven at a constant temperature of 190 ° for a minimum time of 50 minutes.

4. Controls and packaging

Controls: in this phase the material still attached to the system of painting, suffers a careful visual check by which ensures that the material is uniformly painted, that there are no differences in color, bubbles and cracks.

Packaging: only if the material is painted perfectly packaged individually, by a special coupling of bubble wrap 120 gr + expanded by 2 mm, and subsequently packed together with the other by plastic strapping.

PAINTING PROCESS FOR SALINE ENVIRONMENTS

Besides a purely aesthetic function, this painting process for salty environments guarantees a long protection in particularly aggressive environments.

The painting process for salt environments is developed in the following phases:

- 1.** Alkaline degreasing to remove organic contaminants such as processing oils and flow-coating storage residues, for a time of 5 minutes with water and product at temperature of 60°;
- 2.** Flushing flow-coating with tap water for 5 minutes;
- 3.** Flow-coating pickling based on phosphoric acid at a temperature of 50°, for a time variable according to the oxidation of zinc to obtain a good adherence of the paint;
- 4.** Flushing flow-coating with mains water at room temperature for 5 minutes;
- 5.** Fluozirconic flow-coating passivation no chrome-free rinse suitable for depositing on the piece with an excellent chemical anchor a layer of 0.5-0.6 micron thickness of fluoride zirconium necessary for an excellent corrosion resistance and oxidation to improve the blistering (paint peeling);
- 6.** Flushing flow-coating with mains water at room temperature for 5 minutes;
- 7.** Final flow-coating rinsing with demineralized water at room temperature for 8 minutes;
- 8.** Drying in oven at 130/50°;
- 9.** Application of primer based on epoxy zinc powder 50/60 micron thickness;
- 10.** Polymerization in ventilated oven with forced air circulation up to complete cross-linking of the paint film respecting the indications given in the supplier's data sheet 180° oven temperature product;
- 11.** Application of TGIC Free polyester powder in the cab with n° 10 automatic guns up to reach 60/70 microns thick;
- 12.** Polymerization in ventilated oven with forced air circulation up to complete cross-linking of the paint film respecting the indications given in the supplier's data sheet 180° oven temperature product;
- 13.** Quality Controls: in this phase the material still fixed to the painting plant suffers a accurate visual check by means of which it is ensured that the material is uniform painted, that there are no differences in color, bubbles and cracks;
- 14.** Packaging: only if perfectly painted, the material is individually packed by means of a special lamination of 120g + 2 mm bubble wrap, e subsequently packaged together with the others using plastic straps.

STRAIGHT TAPERED POLES

Our tapered poles are constructed with longitudinally welded tubes by induction, made of steel sheet S235JR (EN 10219-01).

The tubes of different diameters, are joined together by circumferential welding in matching to tapers.

For each pole, if for buried line, the following processes are realized:

cable entry slot;

application of pocket grounding;

terminal board slot.

All poles are calibrated on top with stem height 180 mm and Ø 60 mm suitable for mounting accessories and lighting.

The galvanization of materials is obtained by dipping into bath of molten zinc which thickness of the zinc coating is conform with UNI EN ISO 1461.

The poles are made in compliance with the UNI EN 40-5 and related regulations:

Dimensions and tolerances: UNI EN 40-2;

Materials: UNI EN 40-5;

Specification for characteristic loads: UNI EN 40-3-1;

Verification by calculation: UNI EN 40-3-3;

Surface protection: UNI EN 40-4.

Each pole comes with adhesive label CE.

STRAIGHT TAPERED POLES

Straight Tapared Poles - in configuration with single arm (BS series, see page 84)

Considering the application of 1 0.12 m² street light

Ogni casella contiene un codice numerico composto da 4 cifre, le prime due indicano l'altezza dello sbraccio mentre le seconde due indicano la sporgenza

STRAIGHT TAPERED POLES

STRAIGHT TAPARED POLES - in configuration with double arms (BD series, see page 84)

TAPERED POLES FOR AIRLINE

Our tapered poles for airline are constructed with longitudinally welded tubes by induction, made of steel sheet S235JR (EN 10219-01).

The tubes of different diameters, are joined together by circumferential welding in matching to tapers.

At each pole for airline are made the following processes:

application of the pocket grounding to 900 mm from the base;

eyebolt, for the passage of the line cord, welded 6,000 mm from foot traffic (for poles 6,000 mm above ground), or welded to 6,700 mm for height poles higher;

threaded hole complete with nut made behind the eyelet for the application of grounding system;

entry hole for the power cord of the lighting , realized in 100 mm from the threaded hole.

All poles are calibrated on top with stem height 180 mm and Ø 60 mm suitable for mounting accessories and illuminating.

The galvanization of materials is made by dipping into bath of molten zinc whose thickness of the layer of zinc is conform with UNI EN ISO 1461.

The poles are made in compliance with the UNI EN 40-5 and related regulations:

Dimensions and tolerances: UNI EN 40-2;

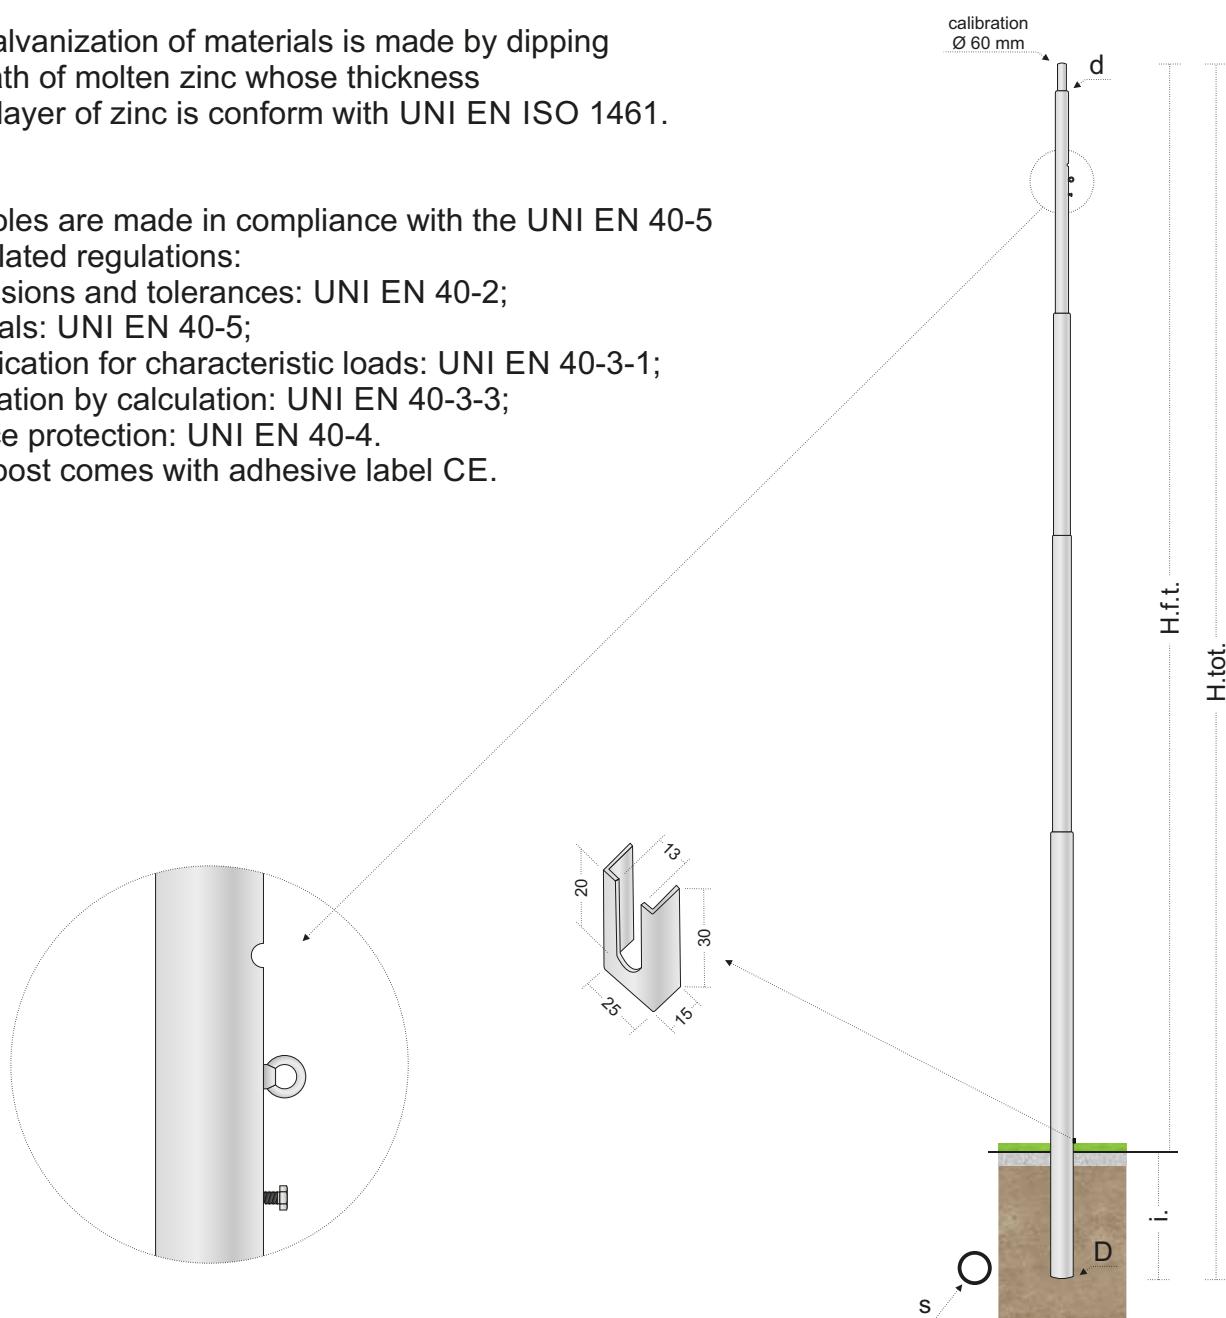

Materials: UNI EN 40-5;

Specification for characteristic loads: UNI EN 40-3-1;

Verification by calculation: UNI EN 40-3-3;

Surface protection: UNI EN 40-4.

Each post comes with adhesive label CE.

In general, a 140 Wp photovoltaic panel develops 1.00 m² of wind-exposed surface

LED ROAD LIGHTING ZORA SERIES

LED street lighting with high efficiency optics.

Body entirely in die-cast aluminum with inclination adjustment support.

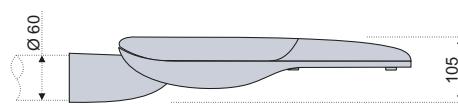

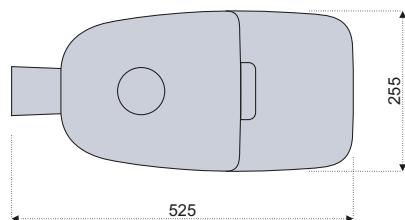

Painted with thermosetting powders in 190° oven, satin gray RAL 9007.

Watertight cable gland for Ø 9-12 mm cable, filter and anticondensation valve.

Transparent glass, 5 mm thick, tempered, resistant to impact and thermal shock.

Opening without tools and with locking device for accidental closing of the shell in maintenance phase.

Reduced maintenance thanks to the average life of each LED above 100,000 hours.

PROFILES

For each stand alone kit, 2 U profiles will be supplied. These accessories, fixed by pole-top screws, constitute the load-bearing structure of the photovoltaic panels.

CLAMPS

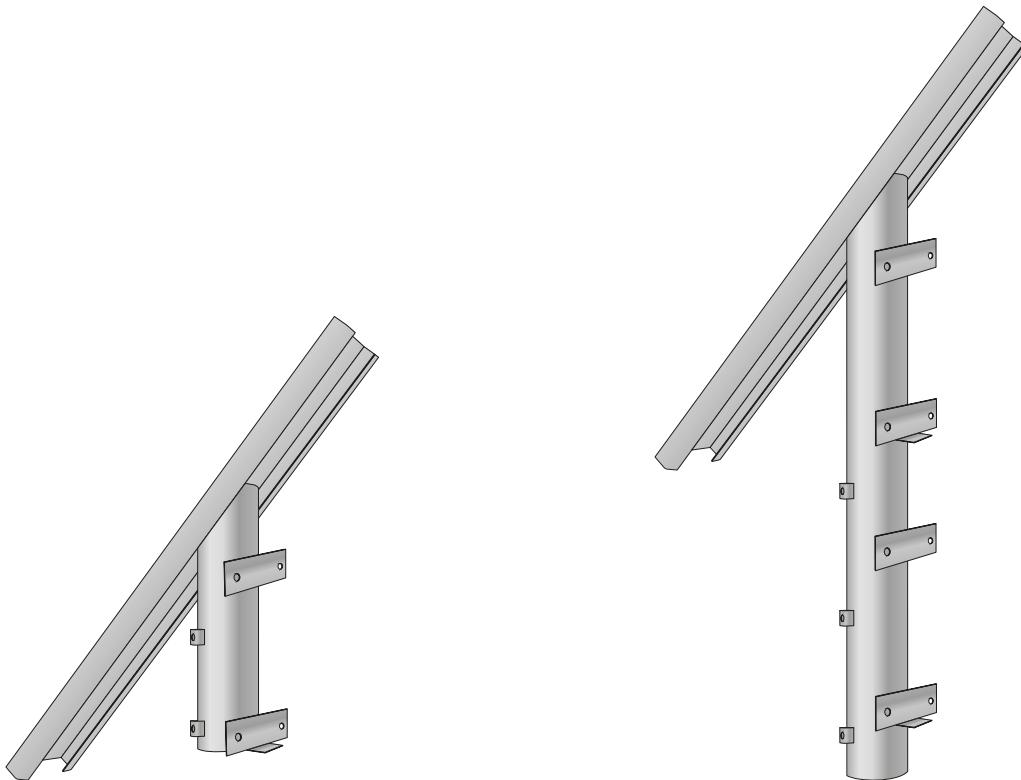

For each stand-alone kit, 4 galvanized clamps will be supplied. These accessories allow the photovoltaic panel to be fixed to the profiles.

POLE-TOP

The pole-top is a simple angled structure with a cup-top grafting system. The pole-like structure, through a series of predispositions, allows the fixing of the charge regulator, pro files and battery box.

BATTERY BOX

The battery box consists of a lamellar structure equipped with dissipating slots and a lockable rear door. In this structure the battery will be positioned preserving it from the action of atmospheric agents.

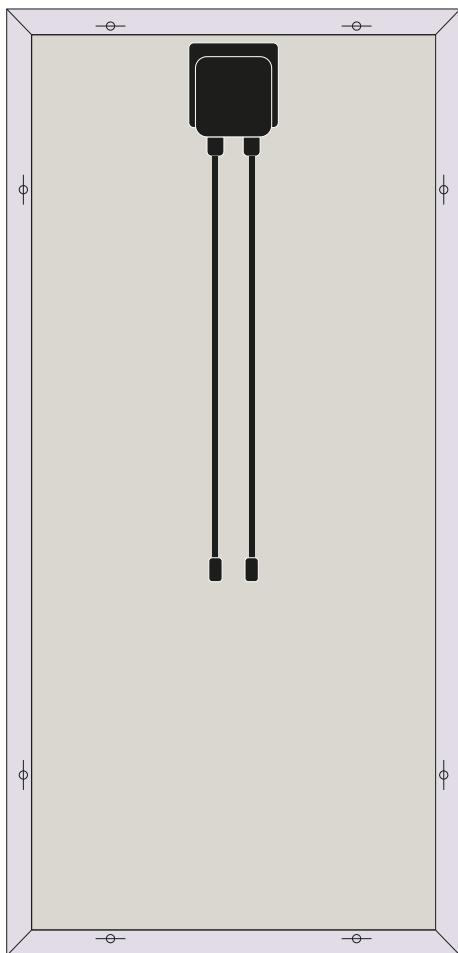

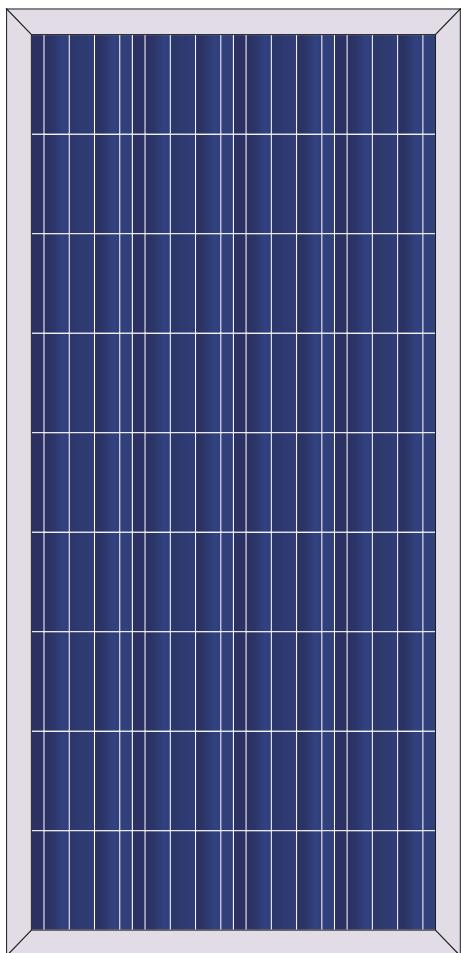

PHOTOVOLTAIC MODULES

Depending on the kit chosen, it is possible to have a 145Wp or 250Wp panel. These panels are suitable for companies and environments, as well as for big dimensions implants.

Thanks to the commitment of high quality photovoltaic cells, polycrystalline silicon modules they reach an energy yield that is above average and the search for facts continues to be reliable even in non-optimal environmental conditions.

The frame, very light but at the same time extremely resistant, facilitates installation and confer a strength to the panel.

BATTERIES

Batteries designed for optimum performance and to protect against network disturbances.

Ideal for renewable energy storage systems.

Optimized for discharges up to 20 hours.

VRLA AGM and gas recombination technology, with 99% of the recombined internal gases.

No maintenance, no topping up.

Not dangerous for transport by air / sea / rail / road. 100% recyclable.

Technical features

Grid	Obtained by gravity casting with highly pure lead-calcium-tin alloy.
Separators	Electrolyte completely absorbed in high-fiber glass separators (AGM) microporosity.
Terminal connection	Threaded insert that guarantees high conductivity and allows easy installation.
Polar sealing	High reliability polar passages, specially designed to prevent them acid infiltration in a wide temperature range.
Unidirectional safety valve	Allows excess gas to come out in the event of overcharging.
Fireproof device	Prevents sparks or flames from entering the battery.
Containers and lid	Designed with thick ABS walls for high mechanical strength.
Self-discharge	<2% per month at 20° C, allows 6 months of storage without recharging.

CHARGE CONTROLLER

The charge controller is a complete solution for the realization of photovoltaic systems, to power road sign systems, lighting systems, small users a low voltage and for recharging batteries in campers or boats.

This charge controller implements a search circuit of maximum panel power which, regardless of the battery voltage and its state of charge, always makes the work PV module at its maximum power point.

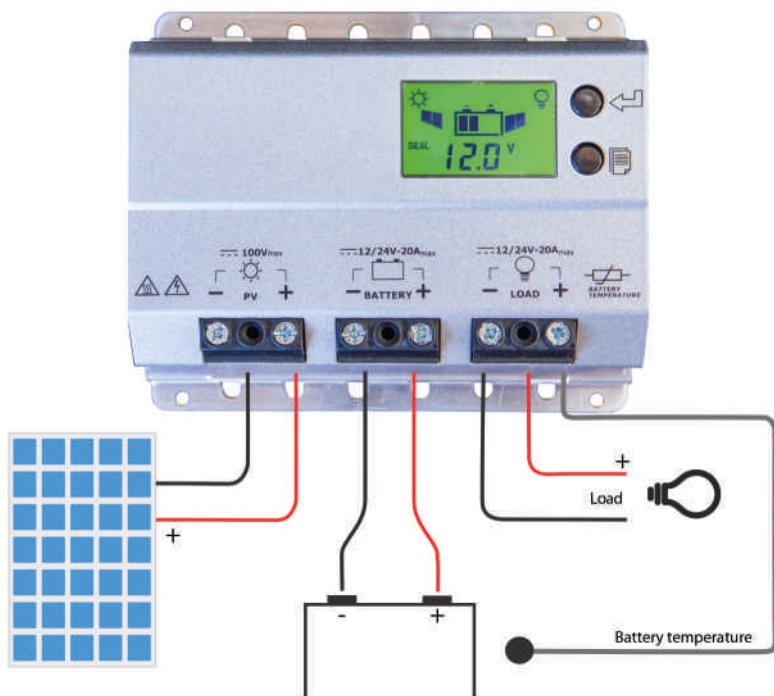

With the regulator, you can also install the cheapest modules normally used for systems connected to the network, with a number of cells different than 36 or 72.

Furthermore, it is possible to use the amorphous silicon modules normally not suitable for PWM regulators.

The Controller detects the day / night status based on the PV module voltage, so it is not additional sensors must be connected. A large display shows the operating status of the regulator, both through simple and intuitive icons, and by displaying the current value charging, the battery voltage, the energy produced by the PV module, the load current e the energy consumed by the load.

Electrical specifications and technical data

Nominal voltage of the system	12 Volt	24 Volt
Battery voltage	10/17V	20/34V
Operating temperature	da -10° C a +50° C	da -10° C a +50° C
Weight kg	0,515	0,515
Cable connectors	1 mm ²	1 mm ²
Degree of isolation	Ip20	Ip20

The poles for small windmills are supports designed for the installation of a small wind generator.

The choice of support will follow an accurate planning phase in which the dimensioning of the pole to be used will be combined with factors such as:

- size, weight and number of wind turbines;
- nominal electric power of the generator;
- characteristics of the rotor;
- working height above the ground;
- minimum and maximum speed of movement of the blades;
- installation area.

Therefore the Carpal staff is at your complete disposal to develop any request.

POLES FOR SPORTS FACILITIES AND ACCESSORIES

POLES FOR SPORTS FACILITIES AND ACCESSORIES

Our tapered poles for sport facilities are made with longitudinally welded tubes by induction, made of steel sheet S235JR (EN 10219-01).

The tubes of different diameters, are joined together by circumferential welding in matching to tapers.

Depending on the use, the poles are made workings of buried line or are applied eyebolts for the passage of ropes to support networking.

All poles are calibrated on top with stem height 180 mm and Ø 60 mm suitable for mounting of the accessories and lightings.

The galvanization of materials is obtained by dipping into bath of molten zinc which thickness of the zinc coating is conform with UNI EN ISO 1461.

The poles are made in compliance with the UNI EN 40-5 and related regulations:

Dimensions and tolerances: UNI EN 40-2;

Materials: UNI EN 40-5;

Specification for characteristic loads: UNI EN 40-3-1;

Verification by calculation: UNI EN 40-3-3;

Surface protection: UNI EN 40-4.

Each post comes with adhesive label CE.

The table below shows a series of articles for the construction of low height fences for sports facilities.

Usually the distance between the poles corresponds to the height above ground of the poles themselves.

Our cylindrical poles are made with longitudinally welded tubes by induction, made of steel sheet S235JR (EN 10219-01).

Usually for these achievements it uses cylindrical tubes of small dimensions as Ø 48 mm or Ø 60 mm; supports of other diameters appear to be less recurrent but easily achievable.

The galvanization of materials is obtained by dipping into bath of molten zinc which thickness of the zinc coating is conform with UNI EN ISO 1461.

The poles are made in compliance with the UNI EN 40-5 and related regulations:

Dimensions and tolerances: UNI EN 40-2;

Materials: UNI EN 40-5;

Specification for characteristic loads: UNI EN 40-3-1;

Verification by calculation: UNI EN 40-3-3;

Surface protection: UNI EN 40-4.

Do not forget the PVC pole closure plugs (page 98) useful to prevent water from entering the poles

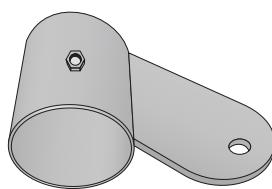

FIXING ACCESSORIES AND REINFORCEMENT DIAGONALS

These accessories allow the fastening of the reinforcement crosspieces (diagonals) to the corner posts for the enclosure of sports facilities.

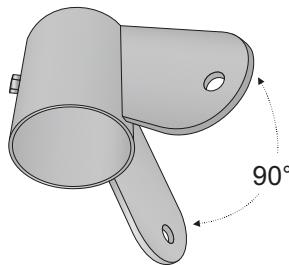

Using the aforementioned articles you will avoid strenuous and destructive operations welding on hot galvanized materials.

These accessories must be inserted from the top of the pole and lowered down placing it at the desired height.

CONICAL STRAIGHT POLES

The straight conical poles in sheet are constructed by bending of circular trapezoid steel sheet S235JR (UNI EN 10025), then the longitudinal edges facing after bending are welded using automated certificate IIS.

Each pole is subject to the following processes:

- cable entry slot;
- application of pocket grounding;
- terminal board slot.

All poles, thanks to the taper of 10 mm/m ending at the top with a diameter of 60 mm suitable to the mounting for accessories and lighting.

The galvanization of materials is obtained by dipping into bath of molten zinc which thickness of the zinc coating is conform with UNI EN ISO 1461.

The poles are made in compliance with the UNI EN 40-5 and related regulations:

Dimensions and tolerances: UNI EN 40-2;

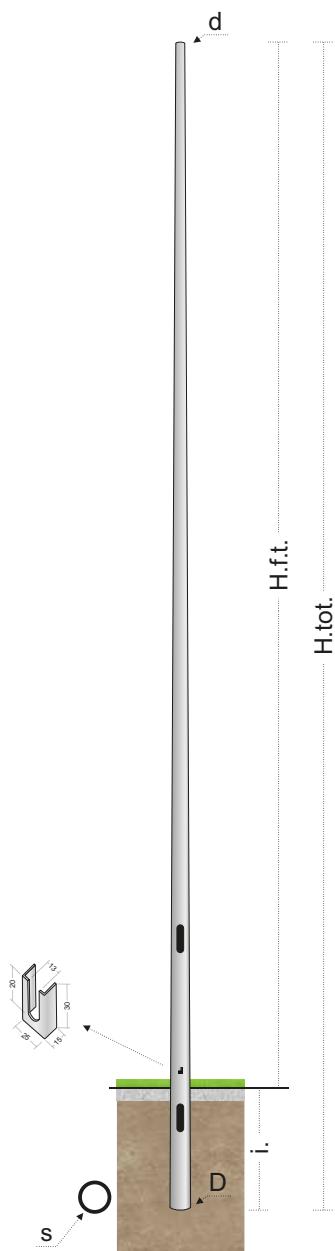

Materials: UNI EN 40-5;

Specification for characteristic loads: UNI EN 40-3-1;

Verification by calculation: UNI EN 40-3-3;

Surface protection: UNI EN 40-4.

Each post comes with adhesive label CE.

Considering the application of 1 street lighting armor of 0.12m^2

STRAIGHT CONICAL POLES - in configuration with double outreach (BD series, see page 84)

Considering the application of 2 street lighting armor of 0.12m^2 each

Each box contains a numeric code consisting of 4 digits, the first two indicate the height of the arm while the second two indicate the protrusion

The conical bent poles in sheet metal are constructed by bending of circular trapezoid steel sheet S235JR (UNI EN 10025), then the longitudinal edges facing after bending are welded using automated certificate IIS.

At each pole are made the following processes:

- cable entry slot;
- application of pocket grounding;
- terminal board slot.

All poles, thanks to the taper of 10 mm/m ending at the top with a diameter of 60 mm suitable to the mounting of a street lighting.

Subsequently, the straight poles are subjected to cold bending on suitable matrices and by the action of an electric winch assume the required curvature.

The galvanization of materials is obtained by dipping into bath of molten zinc which thickness of the zinc coating is conform with UNI EN ISO 1461.

The poles are made in compliance with the UNI EN 40-5 and related regulations:

Dimensions and tolerances: UNI EN 40-2;

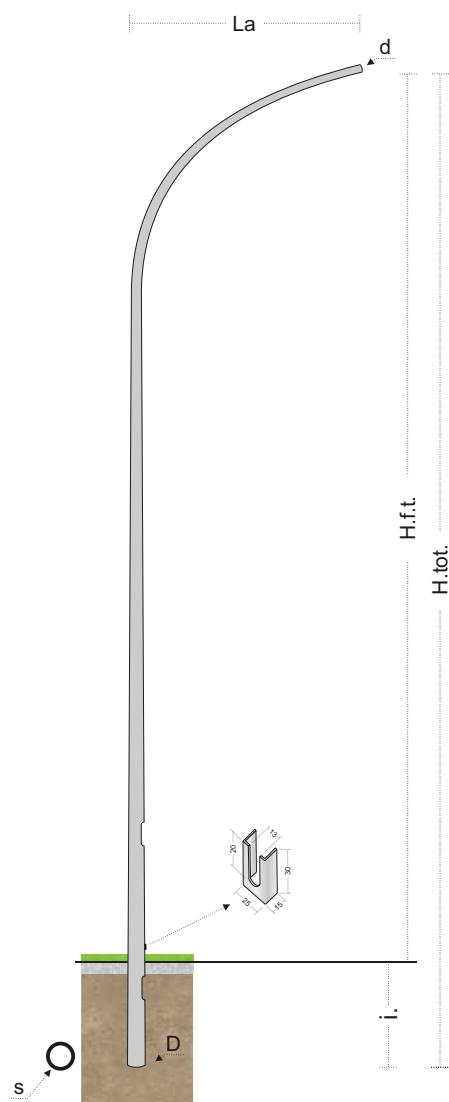

Materials: UNI EN 40-5;

Specification for characteristic loads: UNI EN 40-3-1;

Verification by calculation: UNI EN 40-3-3;

Surface protection: UNI EN 40-4.

Each post comes with adhesive label CE.

These conical poles are suitable for the application of a 0.12 m² street lighting armor

CONICAL CURVED POLES

TAPERED STRAIGHT POLES HOT ROLLED IN HSP

Our tapered straight laminates poles are obtained by hot rolling of steel tubes UNI EN 10025 welded IN high frequency "ERW (Electrical Resistance Welded)" UNI EN 10217.

The lamination/rotationpressing tube contents at a temperature around 700° C, the processing is fully managed CNC.

The poles are made of steel S275JR.

The lamination process allows to obtain a pole without external weld beads.

At each pole, the following operations are performed:

- cable entry slot;
- application of pocket grounding;
- terminal board slot.

All poles ending on top with Ø 60 mm suitable for mounting accessories and illuminating.

The galvanization of materials is obtained by dipping into bath of molten zinc which thickness of the zinc coating is conform with UNI EN ISO 1461.

The poles are made in accordance with the UNI EN 40-5 and related regulations:

Dimensions and tolerances: UNI EN 40-2;

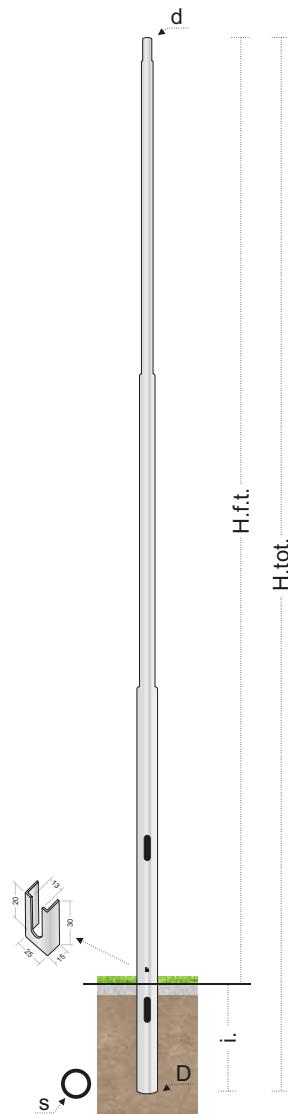

Materials: UNI EN 40-5;

Specification for characteristic loads: UNI EN 40-3-1;

Verification by calculation: UNI EN 40-3-3;

Surface protection: UNI EN 40-4.

Each post comes with adhesive label CE.

CONICAL CURVED POLES HOT ROLLED IN HSP

Our conical curved laminates poles are obtained by hot rolling of steel tubes UNI EN 10025 welded in high frequency "ERW (Electrical Resistance Welded)" UNI EN 10217. The lamination / pressorotazione tube occurs at a temperature of about 700° C, the processing is fully managed CNC. The poles are made of steel S275JR. The lamination process allows to obtain a pole without external weld beads.

At each pole, the following operations are performed:

- cable entry slot;
- application of pocket grounding;
- terminal board slot.

All poles ending on top with Ø 60 mm suitable for mounting accessories and bodies illuminating.

Subsequently, the straight poles are subjected to cold bending on suitable matrices and by the action of an electric winch assume the required curvature.

The galvanization of materials is obtained by dipping into bath of molten zinc whose thickness of the zinc coating complies with UNI EN ISO 1461.

The poles are made in accordance with the UNI EN 40-5 and related regulations:

Dimensions and tolerances: UNI EN 40-2;

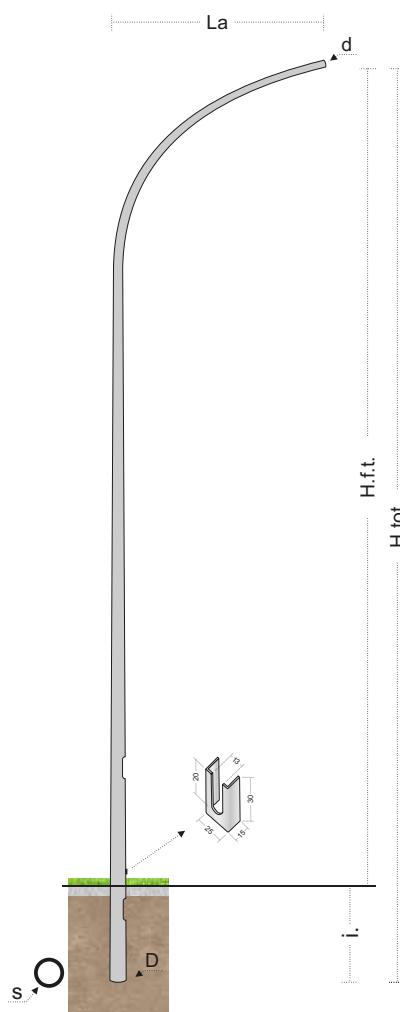

Materials: UNI EN 40-5;

Specification for characteristic loads: UNI EN 40-3-1;

Verification by calculation: UNI EN 40-3-3;

Surface protection: UNI EN 40-4.

Each post comes with adhesive label CE.

CYLINDRICAL POLES

CYLINDRICAL POLES

Our cylindrical poles are made of steel sheet S235JR (EN 10219-01).

Usually for this realizations are used as the specific diameters Ø 89 mm or the Ø 102 mm; poles of other diameters appear to be less recurrent but quietly achievable.

The closure of the top of the cylindrical poles is achieved by a bottom plate, welding in circumferential manner at the top of the pole, on that cap is subsequently welded centrally and vertically, a cylindrical sleeve Ø 60 mm for allowing the accommodation of the lighting fixtures or any other of our top accessory.

At each pole are made the following processes:

- cable entry slot;
- application of pocket grounding;
- terminal board slot.

The galvanization of materials is obtained by dipping into bath of molten zinc which thickness of the zinc coating is conform with UNI EN ISO 1461.

The poles are made in compliance with the UNI EN 40-5 and related regulations:

Dimensions and tolerances: UNI EN 40-2;

Materials: UNI EN 40-5;

Specification for characteristic loads: UNI EN 40-3-1;

Verification by calculation: UNI EN 40-3-3;

Surface protection: UNI EN 40-4.

Each post comes with adhesive label CE.

POLES FOR FLAG-RAISING AND POLES FOR BANNER HOLDERS

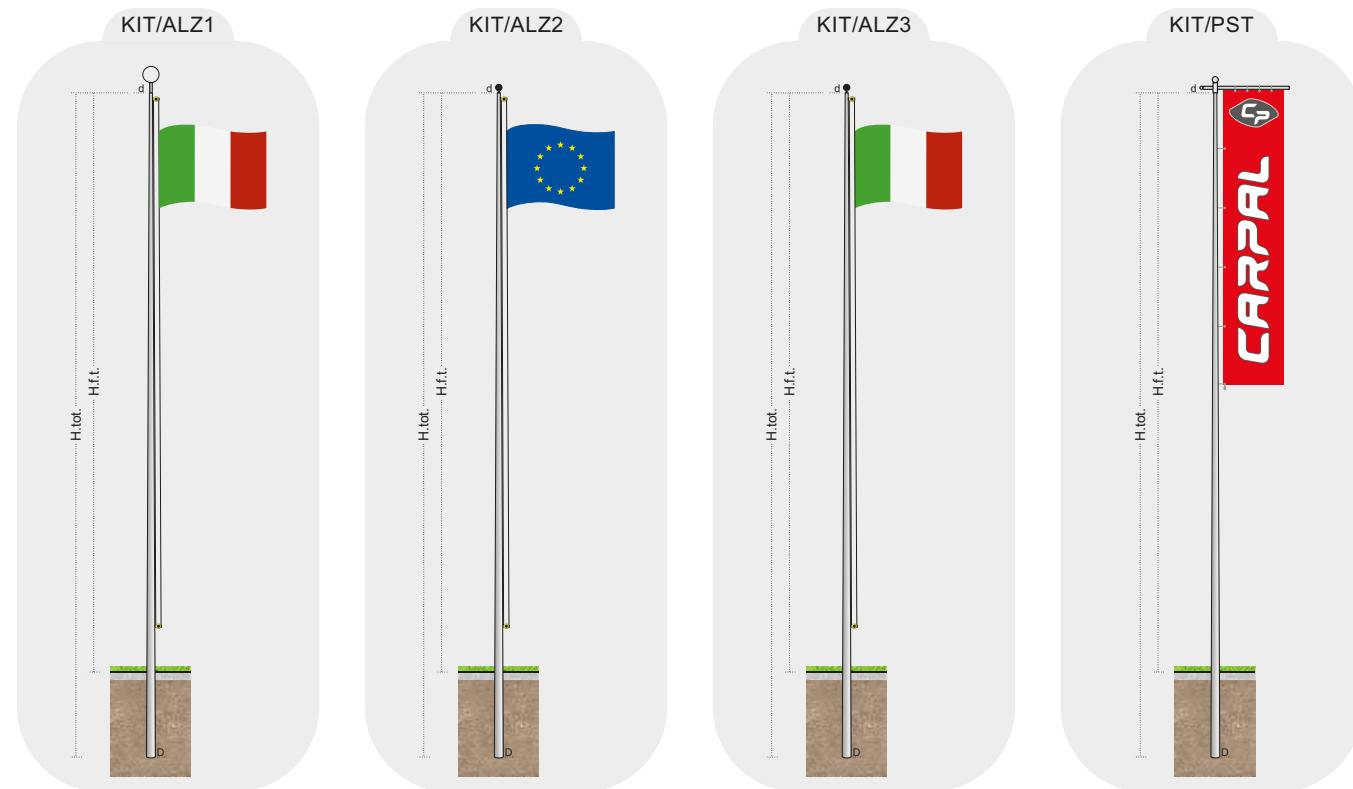

For the realization of poles for flag-raising and poles for banner holder can be used tapered and conical poles, of any height, by us adequately prepared for the application of one of the KIT underposts.

For each pole for flag-raising are made for the following processes:

- cable entry slot;
- application of pocket grounding;
- preparation and supply of caps basis, of terminals, threaded holes and welded nuts for the application of the desired kit.

The galvanization of materials is obtained by dipping into bath of molten zinc which thickness of the zinc coating is conform with UNI EN ISO 1461.

Each post comes with adhesive label CE.

ACCESSORIES FOR FLAG-RAISING AND BANNER HOLDER

Article Code	Description	Unit Price €
KIT/ALZ1	Composed of 2 pulleys + cylindrical terminal Ø 220 mm	115,00
KIT/ALZ2	Composed of n° 2 pulleys + spherical terminal Ø 102 mm	135,00
KIT/ALZ3	Composed of n° 2 pulleys + spherical terminal Ø 102 mm + base cap	195,00
KIT/PST	Composed of n° 2 decorative spheres and a bannerholder system	335,00

For the realization of a flag-raising /banner holder system, you have to choose the desired height pole, and to it you must add one of the 4 kits. (Example: Pole R1398Z + KIT / ALZ1)

The poles for canopies shading are supports made by using conical poles sheet in steel S235JR (UNI EN 10025), bent in order to obtain the required characteristics.

These poles can be supplied for direct burying in the foundation plinth, both with special base flange.

Each post is equipped with pocket for canopies grounding welded to the base and cap laminated PVC closure ends.

The recommended spacing (between pole and pole), for the realization of a shading structure standard, is about 5 meters.

The pole is used a conical straight sheet to 6,800 mm, 4 mm thick base with Ø 128 mm and top Ø 60 mm, which after bending develops a projection of 4,500 mm and a height maximum measured peak of 2,900 mm.

Between the pole and the pole will be placed 5 sleepers made cylindrical tube Ø 60 mm thickness 3 mm and length 5,000 mm.

These sleepers will be fixed on the back of each pole bent through 5 anchoring systems provided by us.

The galvanization of materials is obtained by dipping into bath of molten zinc which thickness of the zinc coating is conform with UNI EN ISO 1461.

The shading cloth is not supplied.

EXAMPLE 1

Single module for 2 cars:

For the realization of a single module suitable for the parking of 2 cars, it will be necessary to get:

- 2 curve poles (C4128Z/PENS)
- 5 cross beams (CIL605Z/IMB)
- 10 couplers (2 ACCP76, 2 ACCP89, 2 ACCP102, 2 ACCP114, 2 ACCP127)

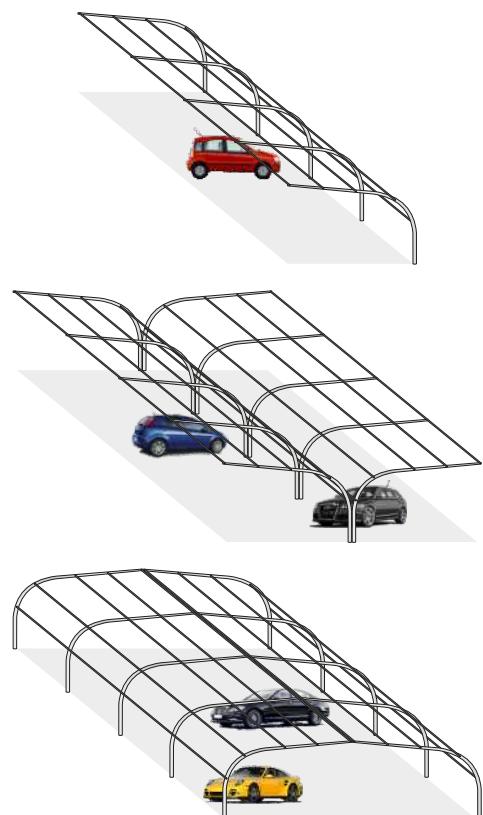

EXAMPLE 2

Double module for 4 cars:

For the realization of a double module suitable for the parking of 4 cars, it will be necessary to get:

- 3 curve poles (C4128Z/PENS)
- 10 cross beams (CIL605Z/IMB)
- 15 couplers (3 ACCP76, 3 ACCP89, 3 ACCP102, 3 ACCP114, 3 ACCP127)

LANDFILLED VERSION

BASED PLATE VERSION

N.B. The pole for cantilever is supplied complete with black PVC lamellar stopper Ø 60 mm for end closure

A simple and cheap system for the assembly of shading shelters. Each pole will welcome 5 ring couplers made with different diameters.

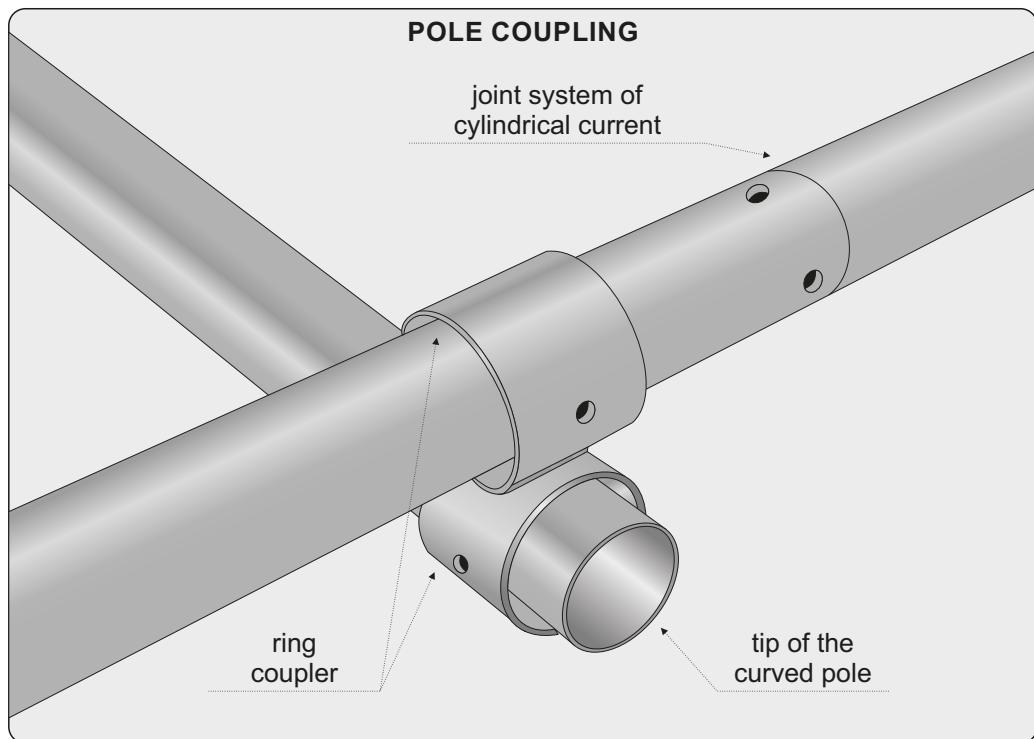

Once inserted from the top of the pole, you will run them to the point of no return, keeping a distance between them (ring / ring) of 1,200 mm they will be blocked by screwing the side screws supplied.

Subsequently it will be necessary to insert each of the 5 crosspieces (cylindrical tube Ø 60 mm thickness 3 mm and length 5,000 mm deep-drawn on one end) inside the upper rings of the couplers.

After this operation, simply tighten the screws to fix everything.

In a short time you will see assembled the supporting structure of your shading shelter.

The shade cloth are to be considered excluded from the supply.

POLYGONAL POLES

The polygonal poles (octagonal/decagonal) straight of sheets are made by folding in subsequent phases of trapezoid in steel sheet S235JR (UNI EN 10025), then the flaps facing longitudinal after folding are welded using automated process IIS certificated.

At each pole are made the following processes:

- cable entry slot;
- application of pocket grounding;
- terminal board slot.

The galvanization of materials is obtained by dipping into bath of molten zinc which thickness of the zinc coating is conform with UNI EN ISO 1461.

The poles are made in accordance with the UNI EN 40-5 and related regulations:

Dimensions and tolerances: UNI EN 40-2;

Materials: UNI EN 40-5;

Specification for characteristic loads: UNI EN 40-3-1;

Verification by calculation: UNI EN 40-3-3;

Surface protection: UNI EN 40-4.

Each pole comes with adhesive label CE.

LIGHTING TOWERS

The lighting towers are structures built to support projectors and accessories, are made with tubular sections of truncated pyramid shape press-folded sheet and welded longitudinally. These sections should then be assembled on site by grafting forced (Slip on Joint). The stems are made of steel sheet S355JR UNI 10025 press-folded in subsequent stages and welded with welding process certificate IIS.

The light towers can be classified into three categories:

- with fixed platform;
- with mobile crown manual;
- with mobile crown electric (roundup or integrated).

For each tower are made the following processes:

- cable entry slot (if is the type buried)
- application to 180° of n° 2 grounding conductors;
- buttonhole inspection.

The galvanization of materials is obtained by dipping into bath of molten zinc which thickness of the zinc coating is conform with UNI EN ISO 1461.

LIGHTING TOWERS IN FIXED PLATFORM

Each lighting tower in fixed platform is equipped with a caged lift ladder, with intermediate rest area and a superior sizing platform suitable for the pre-established use.

LIGHTING TOWERS

LIGHTING TOWERS WITH MOBILE CROWN

The lighting towers in mobile platform are constituted by a crown, made of structural steel cold shaped and welded, that attached to the lifting head by elastic brackets and cables, allows to reach the top of the tower and descend to 1,600/1,700 mm from the ground for maintenance operations.

ASSEMBLY TOWERS

Carpal between the services offered to its customers provides, on request, the installation of lighting towers, run by a qualified team and provided with all the equipment necessary.

CURVED CYLINDRICAL OUTREACHES

Our cylindrical outreaches are made with steel pipes S235JR Ø 60 mm thickness 3 mm curved to the desired radius. The lower part of the outreach, in order to allow the accommodation on all types of Carpal pole, is enlarged with special press realizing a dinghy Ø 70 mm drilled and threaded for the engagement and subsequent locking on the top of the pole.

The galvanization of materials is obtained by dipping into bath of molten zinc which thickness of the zinc coating is conform with UNI EN ISO 1461.

Outreaches are manufactured in accordance with UNI EN 40-5 and related regulations:

Dimensions and tolerances: UNI EN 40-2;

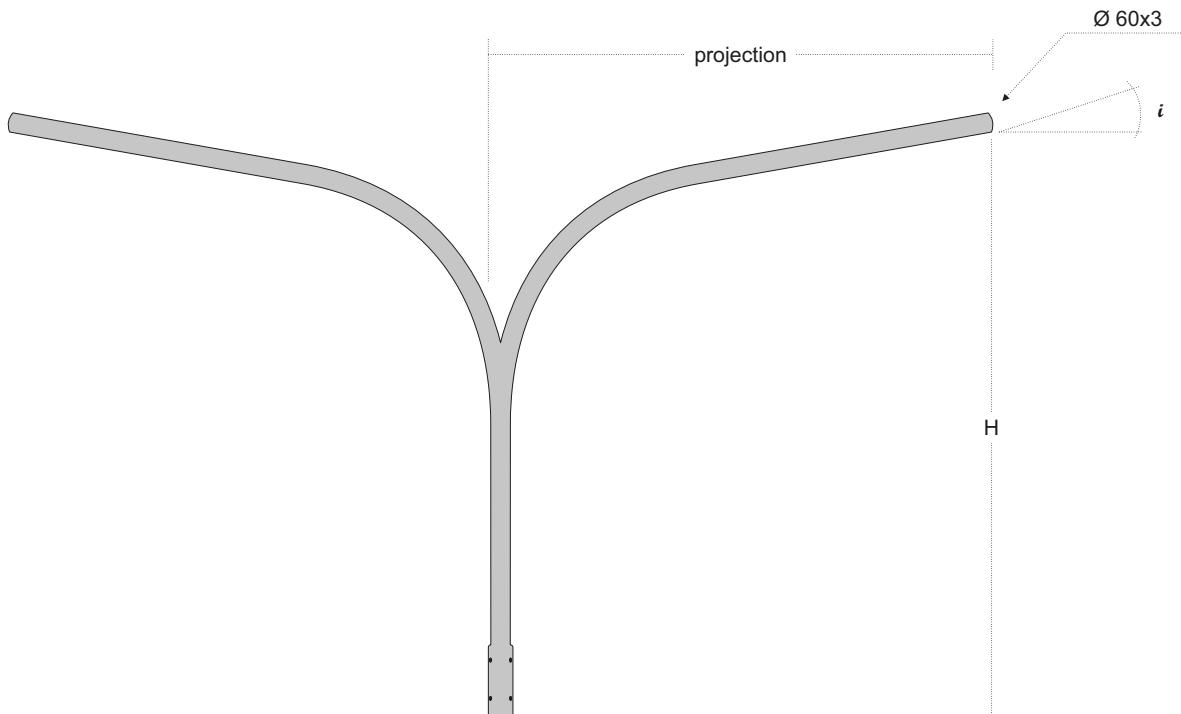

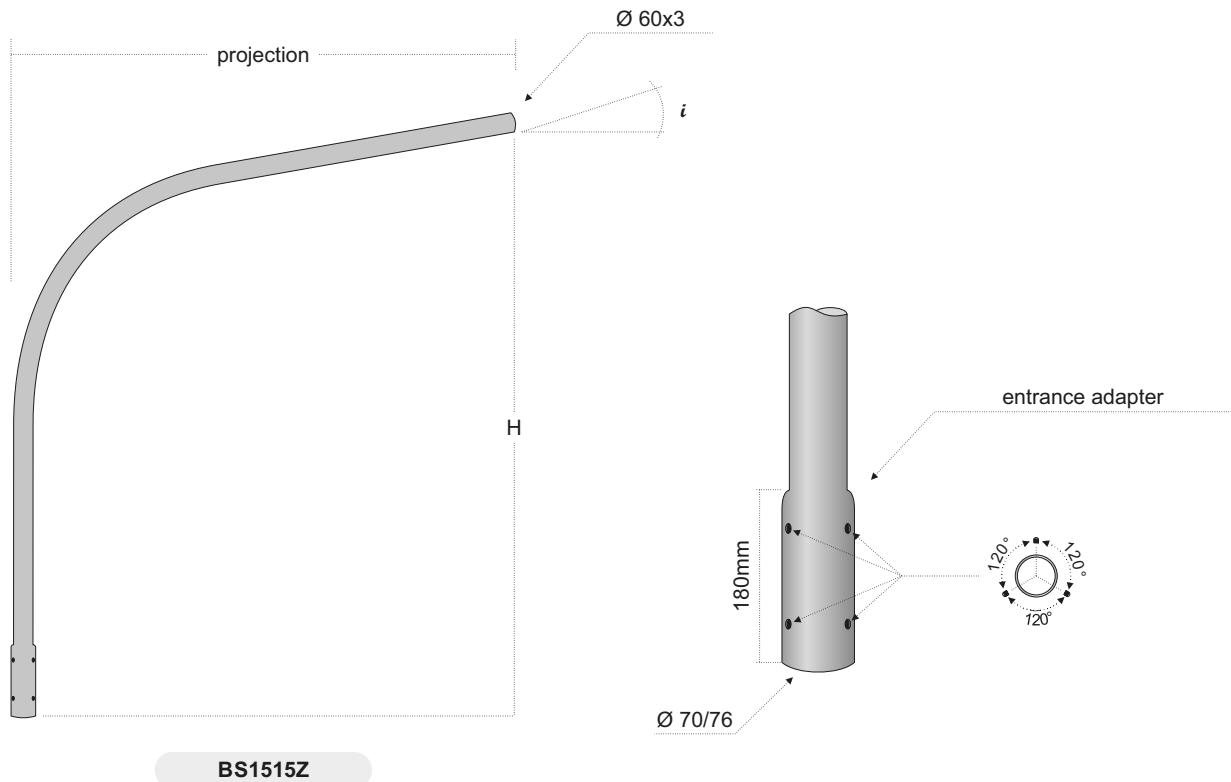

Materials: UNI EN 40-5;

Specification for characteristic loads: UNI EN 40-3-1;

Verification by calculation: UNI EN 40-3-3.

Our projectors brackets are made using a specific C profile strategically slotted (circular brackets made with cylindrical tubes).

The lower part of the brackets, in order to allow accommodation on any type of Carpal's lighting pole, it is made with a cylindrical Ø 70/76 mm tube, drilled and threaded for the locking on top of each pole.

The galvanization of the materials is obtained by immersion in melted zinc tanks whose thickness of the zinc layer complies with the UNI EN ISO 1461 standards.

Dimensions and tolerances comply with the UNI EN 40-2 standards.

STANDARD PROCESSING ON THE BASE OF THE POLE

This box shows the specific, relative to the standard processing, realized at the base of our lighting poles.

For poles with a length lower or equal to 5,500 mm

For poles longer than 5,500 mm

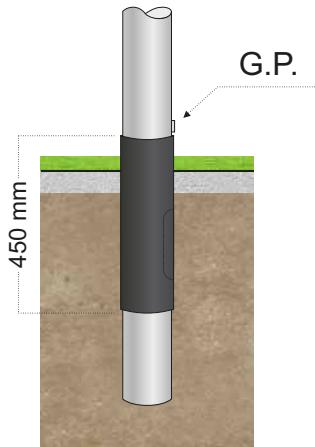

SPECIAL PROCESSING ON THE BASE OF THE POLE

HEAT-SHRINKING SEATH BAND

It consists of the hot application at the base of the pole at the base of a special coextruded cross-linked polyolefin sleeve, fitted inside an adhesive which thanks to the action of the heat adheres perfectly to the galvanized surface.

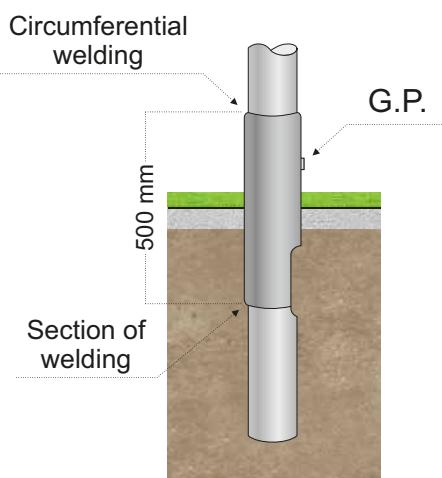

HEAT-SHRINKING SEATH BAND		
Article Code	Description	Unit Price €
FAS80/55	Band for poles with a diameter less than 80 mm	31,00
FAS112/81	Band for poles with a diameter less than 112 mm	33,00
FAS150/104	Band for poles with a diameter less than 150 mm	41,00
FAS196/153	Band for poles with a diameter less than 196 mm	46,00
FAS255/190	Band for poles with a diameter less than 255 mm	69,00

STEEL REINFORCED SLEEVE

The base of the pole can also be reinforced thanks to the application, of a cylindrical steel sleeve S235JR with a height of 500 mm, at the center line of the landfill point, fixed to the base of the pole by welding.

This application is carried out on the raw material which is only subsequently hot-dip galvanized in melted zinc tanks together with the pole.

STEEL REINFORCED SLEEVE		
Article Code	Description	Unit Price €

MACC168/193	Steel sleeve, L. 500 mm at the center line of the landfill point fixed to the base of the pole by welding Ø 168 to 193 mm	72,00

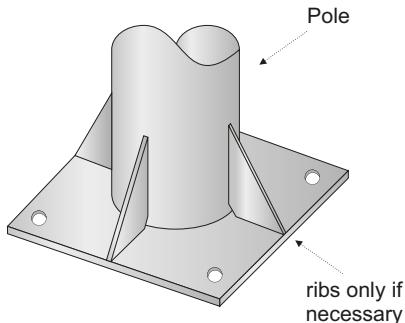

SPECIAL PROCESSING ON THE BASE OF THE POLE

BASIC PLATE (welded to the pole)

An alternative solution to the traditional burial of lighting poles is installation using a base plate. This operation consists in welding at the base of the pole an adequate square plate perforated in steel S355, and if necessary, also the application of 4 triangular reinforcement ribs between the plate and the pole.

This operation precedes the hot dip galvanizing phase.

On request the base plate can also be made of a non-square shape.

STREET FURNITURE

The new market requirement combined with the growing stimuli for innovation have made us ask the attention on the most complicated, but at the same time the most attractive world of the URBAN FURNITURE, in which elements such as shapes, lights, colors and curves combined together can recreate an infinity of new styles and new solutions.

The pole takes connotations that in the past were unimaginable, passing from a cold iron rod to an awesome piece of furniture, straight, semispherical, wavy, pointed, two-tone, overturned, inclined...

we could continue indefinitely but the pages that follow, in a simple and explanatory way, they realize our projects.

We present a series of solutions already implemented, and to follow schematize the main ones furniture lines.

In case you need different sizes, lines or shapes, do not hesitate to contact us, a young and dynamic staff will be at your disposal to satisfy even the most bizarre requests.

A photograph of a paved road curving away from the viewer towards a range of mountains under a clear blue sky. On the right side of the road, there is a series of streetlights mounted on curved poles. In the upper right corner of the image, there is a white speech bubble with a red border containing the word "NAIROBI".

NAIROBI

Nairobi

Curved pole with conical stem, for hanging lanterns.

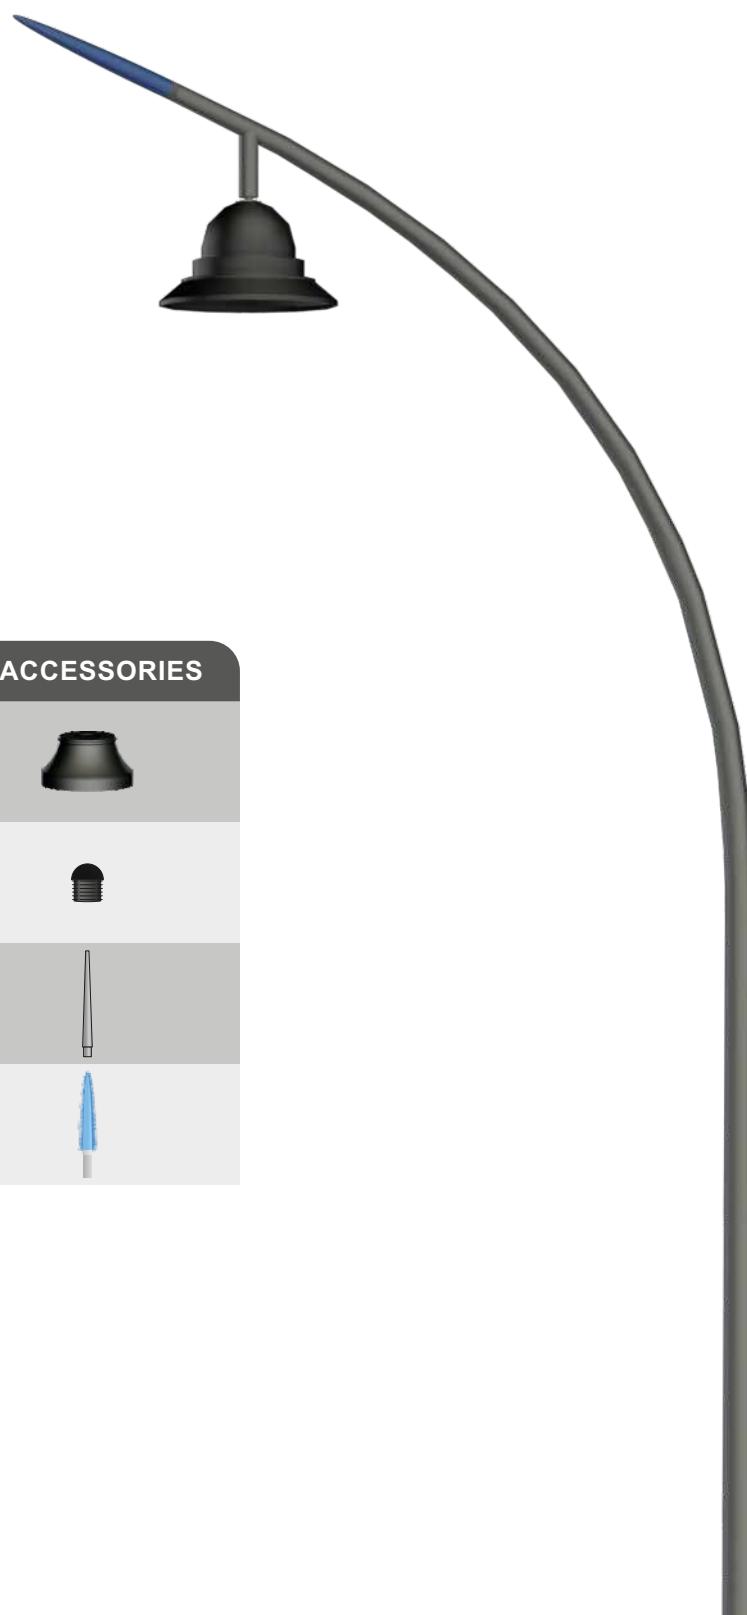

Available in single version, with different heights, turns out to be ideal for lighting pedestrian areas, but also roundabouts and city centers.

It can be embellished with the use of the LED tip.

ROMA

Roma

The Rome line consists of a tapered pole to which is combined a gently wavy outreach made on a cylindrical glass to which a rear tail is welded to recreate a pleasant passing-through effect.

Available in three different protruding, 800, 1,000 and 1,500 mm, in the single, double, triple and quadruple versions, both symmetrical and offset.

TAIPEI

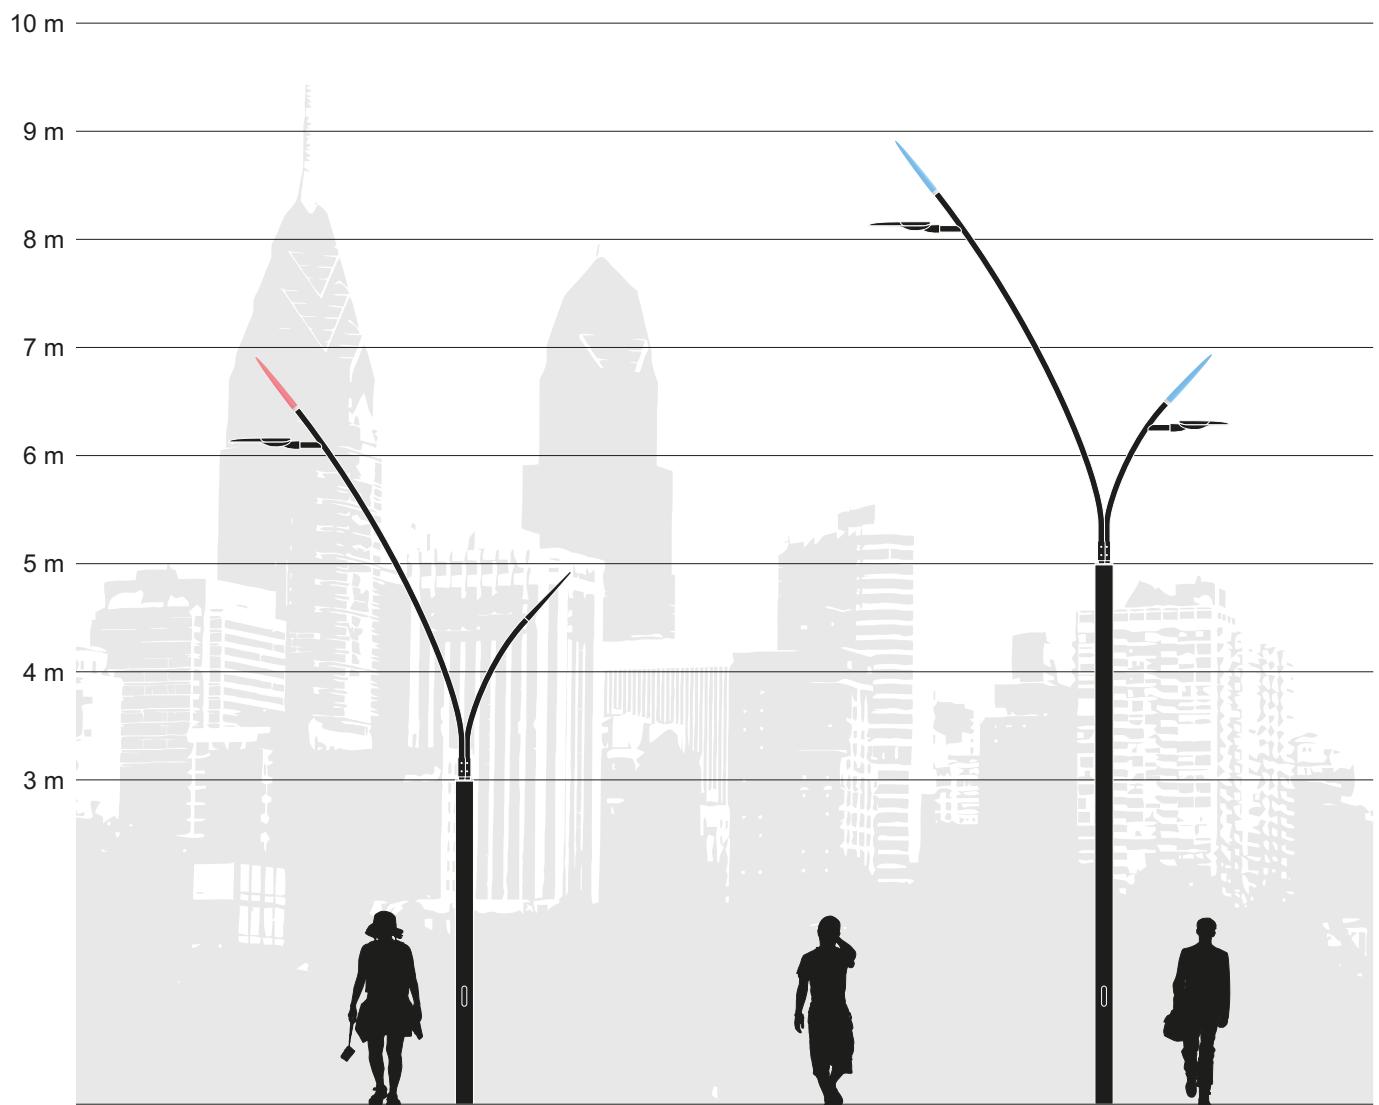

Taipei

Simplicity that becomes ingenuity.

A curious solution for offset lighting or even for a burlesque bifurcated effect.

Embellish it with our conical tips or even better with LED tips.

Available in multiple heights to satisfy every need.

TAIPEI

TIRANA

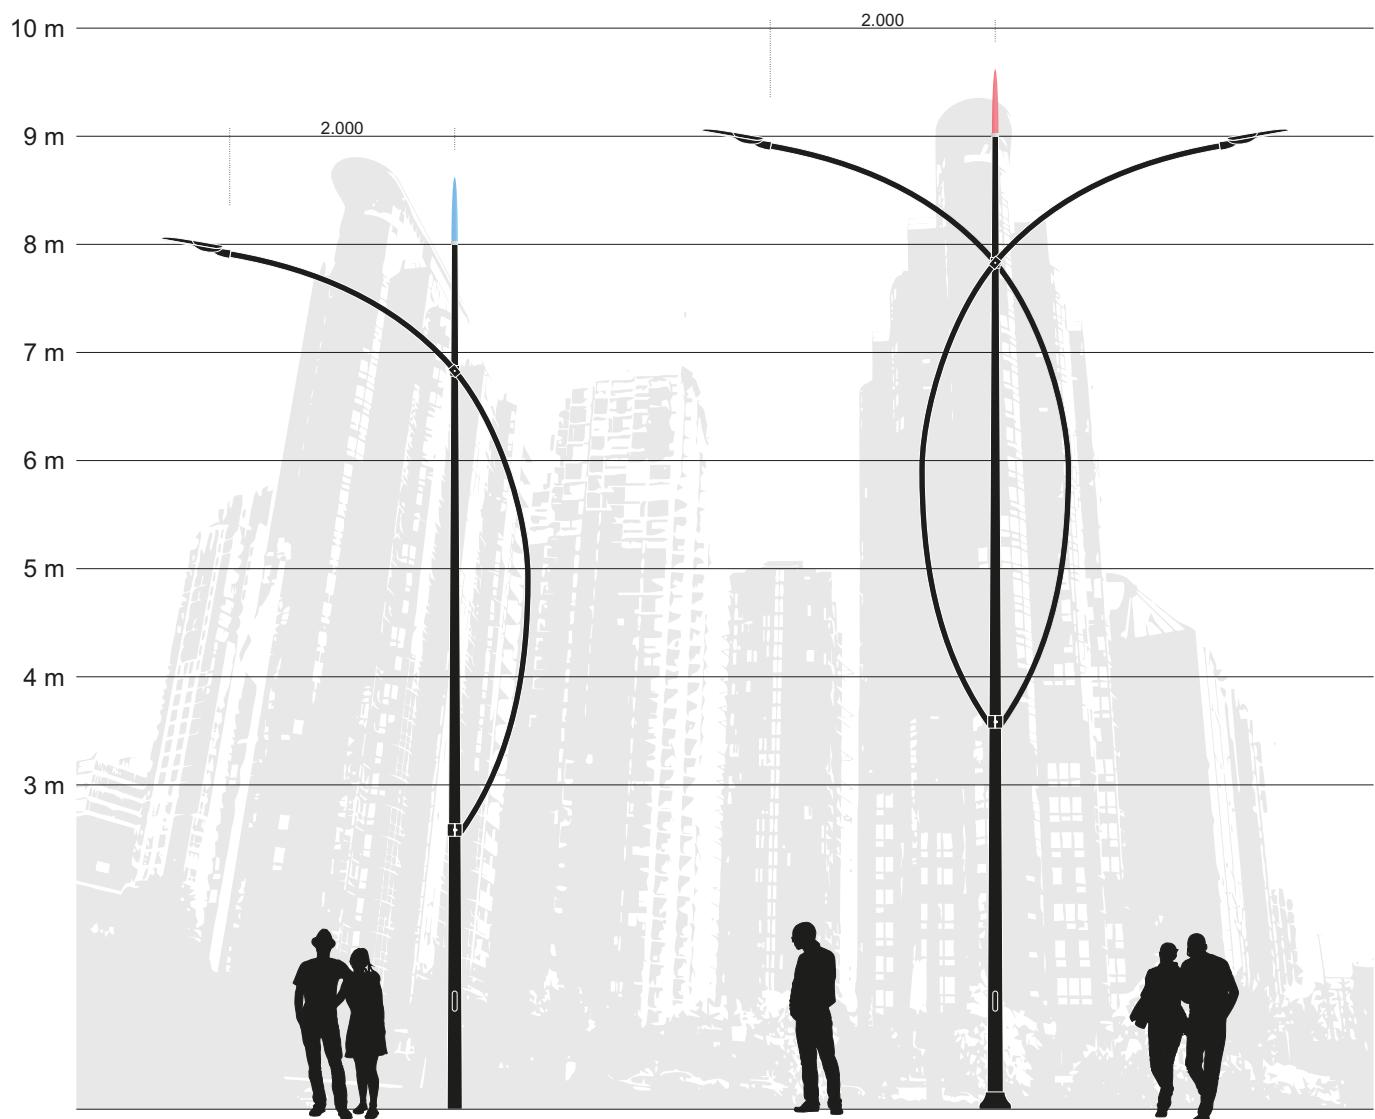

Tirana

Hypnotic, the Tirana model looks like a snake ready to attack its prey.

Not just light, but also energy, power and vigor.

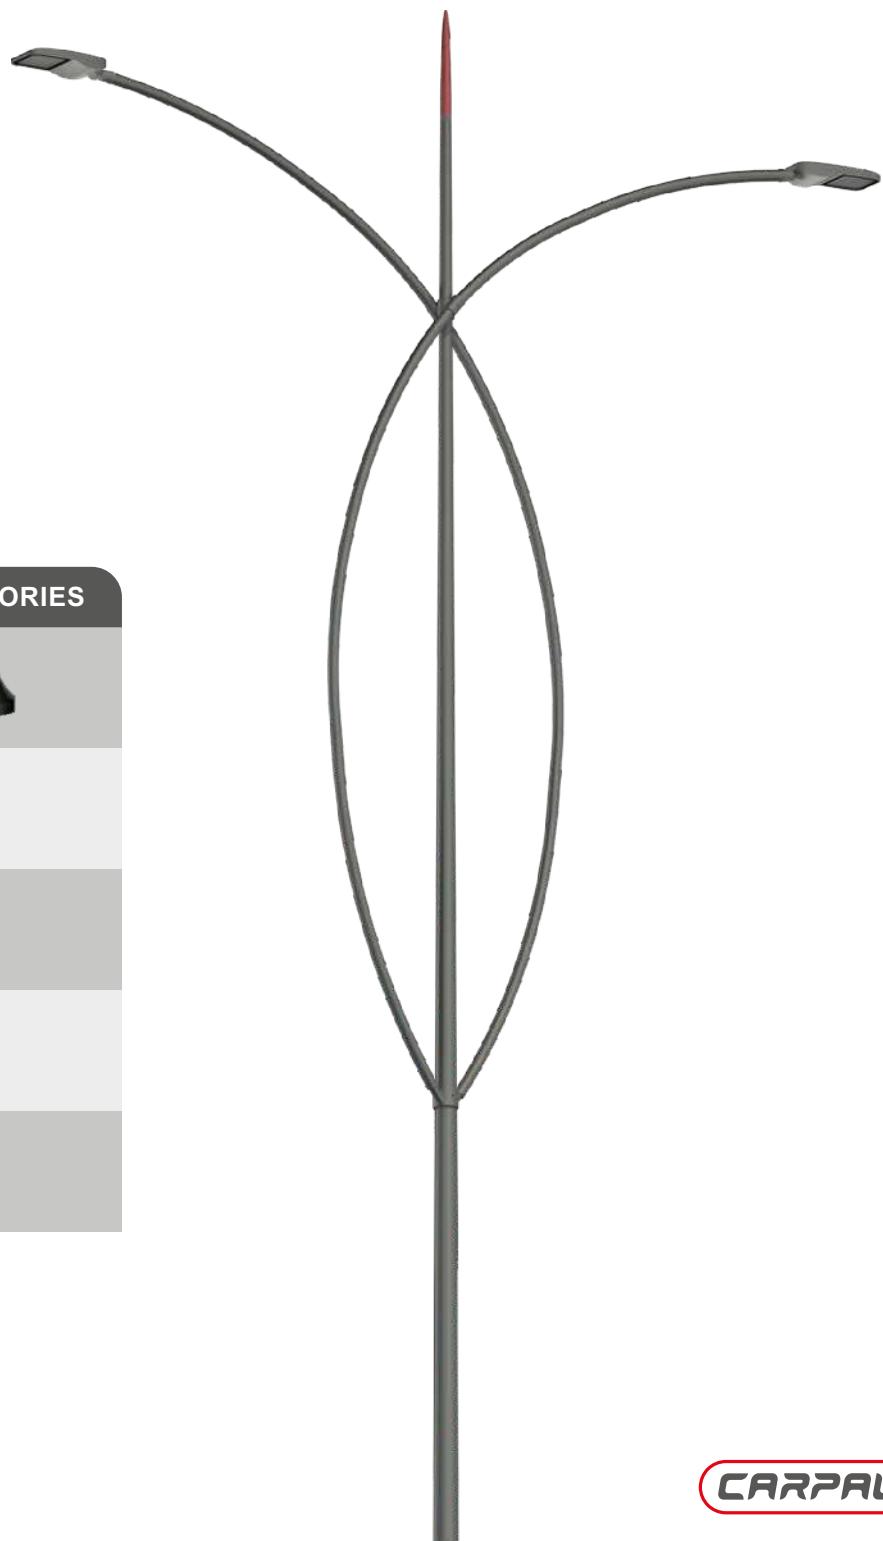

Straight conical central stem and Ø 60 mm lateral appliques in cylindrical steel to support the most performing lighting bodies.

It can be equipped with one of our top pole tips.

In 2019 Carpal srl celebrates its first twenty-five year.

A quarter of a century lived in the name of constant and gradual improvement of our company.

We thank all our customers, our suppliers and all those who have supported and allowed us to write our first five lustres of history.

We thank our dads, Alberto and Bruno, because it is only thanks to their work if today we are here, because they have offered us the means to improve every day and because every single day, tirelessly, they are at our side, they support us and spur us on in our daily challenges.

Fortunato, Emanuele, Lucia, Marco and Luca
